Robocall Mitigation Plan

Gis networking is a PBX Hosting provider located mostly in Israel with customers having offices also in other parts of the world including the USA.

As so the US branches do outgoing calls in the US using US based numbers from official fcc registered providers.

GIS networking enforces customer identification and callerid used by customers for more than 10 years using the following:

1. Every customer must have full contact info with us and signup is by phone only including id info of customers.
2. Customers are verified as being whom they are using a verification process.
3. User can only call outgoing using numbers supplied thru our carriers or verified as being there own number via a strong verification process.
4. Users are limited to amount of outgoing calls they generate at a given time.
5. We openly express to customers the robocalls are not allowed on our network and continuously monitor our network and if done account will be closed.
6. We have started testing STIR/SHAKEN implementations.

If needed we will assist the FCC in mitigating robocalls on our network

Regards,

Israel Gottlieb
