

I was made aware about the Robocalling situation in the USA somewhat late and did not have a chance to properly review solutions such as STIR/SHAKEN that can be implemented on my system. However, I do plan to manually control this situation in the meantime once I am made aware that robo-calling has been identified as originating on my network. Once enough information is provided I can seek out the source and manually chop off the perpetrator.

I am primarily a mobile service provider and I do not have VoIP customers. I do use SIP trunks to transport international voice calls from my MSC, but finding sources for call origination has not been a challenge for me thus far.

However, I am committed to do my part and aid in any way to stop the Robo-calling situation in the USA. I will look into the protocols for STIR/SHAKEN and try to follow the guidelines for implementation.

Best Regards,

Kyle Dasent
