Robocall mitigation plan

SIA Tet (Tet) has implemented solutions that prevent the Tet customers from changing/replacing their phone number.

- 1) Registration of VoIP numbers in the network is based on the telephone number, it is checked whether the number is allowed to make calls and what services are connected.
- 2) "A" number screening has been implemented for SIP trunk connections, where the "A" number received for each call is checked versus the client's connection configuration. If the number has been changed or does not match the customer's configuration, the call is not allowed.
- 3) All Tet customer telephone numbers starts and is accepted just with country code +371.

According to above mentioned, calls starting with NANP numbering resources (+1) - cannot be made from Tet network.

Best regards
