

To whom it may concern,

Velantro, Inc hereby certifies and assures that that as part of our robocall mitigation efforts we are proud to say that we have NO ROBOCALLS originating from our network. Furthermore, it asserts that its network is strictly used for IP endpoints, namely IP Phones thus creating a closed network.

Our company offers PBX service and all (100%) of our client only connect to our network using an IP phone. We do not sell voip traffic, voip trunks or any mass dialing solutions. Moreover, outbound dialing on our network is monitored on two layers. 1) a regular IP phone cannot have an X number of concurrent calls depending on number of lines the physical phone supports thus making an extension not viable for any robocaller. 2) on our class 5 switch we use whats called a normal business usage for the minutes spent by any extension as well as the tenant which owns the pbx extension thus making it literally impossible any robocalls at all. Additionally, we authenticate call-IDS on our class5 switch for call coming from pbx's of our clients as we use caller ID for authentication authorization hence another step making it impossible for fake caller IDs to be used. Finally, We do not sell dialing trunks and our network is a closed strictly for users which have a device or register a single PBX extension.

Thus, no robocall can be originating from our network and all user(human) initiated calls from IP Phones(devices). Moreover, we will comply with the commission, law enforcement or industry consortium to traceback such calls if there were or are any.

Sincerely,

George Gabrielyan

CEO

Velantro, Inc
