

Tele-Tec GmbH Robocall Migration Plan

This document describes the actions and activities taken by Tele-Tec GmbH to detect and migrate robocalls. And in the first place prevent them to be originated in our network.

Tele-Tec operates a business customer network in Austria all A-Numbers are assigned to these customers. With a direct relation between customer address and number. The customer is not able to modify this number. And since Tele-Tec does not do and allow international trading business over its network this limits already the possibility for Robocalls to fraud scenarios.

To prevent possible fraud, we are monitoring our network with a technical and a financial layer of security by different systems. These systems are developed to detect and mitigate unlawful and fraudulent traffic using cutting edge technology.

STIR/SHAKEN is not implemented. Tele-Tec will fully support all activities to prevent fraud and respond to all trace requests from law enforcement, industry traceback consortium and commission. We will work together with such entities to investigate and stop any illegal calling activities. In respect to the limitations due to restrictions of applicable law and regulations applied to us by Austrian law and regulations.
