

Robocall Mitigation Program

As a reseller for Net2phone we offer our local clients with SIP trunking services only. These services are part of a managed package that includes an IPPBX.

The service we provide is configured only by us. Consequently we setup, manage and monitor all the traffic from our local clients.

We have full control of the local IPPBX and therefore no automated calls can be made without our direct involvement, since we would have to provide authenticated access to the IPPBX.

With this approach it would not be possible for a client to generate Robocalls without our knowledge.

Our service approach gives us ultimate control.
