

Paris, the 18th of October 2021,

Axialys provides retail telecommunications services to business users. Those services can be used either :

- with a specific set of software tools, provided by Axialys in order to be used by each user from their desktop
- with a SIP business phone

In either case, the accounts are "single user" and do not include any "robocall" feature, meaning the user has to perform several steps (either on the phone or in the Axialys software) to perform a single call.

Furthermore, our SIP accounts are fairly limited and do not allow a user, even if using a third party tool, to place several calls at the same time.

Finally, we have in house systems permanently monitoring any sort of abuse of our services that would let us know if either :

- an account had significant, abnormal (no "end user alike") outgoing traffic
- our global telecom performance indicators went significantly out of the normal (for instance, ASR)

It is worth noting also that Axialys doesn't have significant business in the US at this time.
