

## **Robocall Mitigation Plan**

## OXIO Corporation

Founded in 2018, OXIO is the world's first Telecom-as-a-Service platform. OXIO creates innovation opportunities as well as time and cost efficiencies for MVNOs, mobile operators, and businesses delivering connectivity across the telecom ecosystem. Our platform offers a programmable and global, one-network solution that defies the traditional boundaries of telecom.

OXIO has built a FULL MVNO platform with a full scale wireless telecommunications core network of its own while partnering with mobile operators like AT&T to provide radio access support for devices that connect to the network.

## STIR/SHAKEN Implementation

OXIO does have the capabilities and facilities necessary to implement STIR/SHAKEN support and this work is currently in progress.

## Additional Robocall Mitigation policies

In addition to the planned support for STIR/SHAKEN Implementation, OXIO provides the following mitigation measures:

### Call Detail Record (CDR) analysis

OXIO collects CDRs from our telecom core network and generates reports where we can look for unexpected call volumes, short duration calls, called party hang ups etc. These reports help us to perform any investigations that may be required

### Blacklists

OXIO implements calling blacklists to mitigate robocalls based on specific attributes like number prefixes, locations, networks that are not ours.
