ROBOCALL MITIGATION PROGRAM DESCRIPTION

Our system uses Asterisk 20 with all users on registered extensions and outbound calls must originate from an extension (ie: 1001). We have in place a PHP AGI program that accesses a SQL a CDR table and blocks any outbound call from an extension that is attempted within 8 seconds of the previous call from that extension. If blocks a call it sends SMS to Client Service IT Administrator.

I Affirm this description with my signature.
